

Php (front page) ports

8001 as asked in the exercise so basically for local use. Site is accessed with typing "localhost:8001" to search bar in browser. 80 is the containers' port.

Database is accessed with localhost:0 but port number "0" makes it inaccessible, because exercise wanted only 1 external access.

Req came from 172.27.0.1 and remote port was 54916. These are my IP and my port.

Req served at 172.27.0.2:8001. These are server address and server port. Request was sent by my client.

If you want to access database, change 0 port to 8080 and insert `"db", "root", "example"` values to the fields at localhost:8080.

Localhost:8001 should print something like:

DevOps course 2020 fall

Req came from 172.27.0.1:33246

Req served at 172.27.0.4:8001
